The Concept of Ba in Nonaka’s Knowledge-Based Theory of the Firm: Research Findings and Future Advancements Towards the Design and Managing of Enabling Contexts in Knowledge Organizations

Autoria: Rivadávia Correa Drummond de Alvarenga Neto, Chun Wei Choo

Abstract: This paper investigates and analyses the concept of ba – or enabling context - in the fields of management/business, information science and information systems literature in order to understand its conceptual evolution, discussions, applications and expansion since its introduction in 1998 by Nonaka et al. (Nonaka and Konno, 1998; Nonaka et al., 2000; Nonaka and Toyama, 2002; Nonaka et al., 2006). The concept of ba is quintessential in Nonaka’s propositions towards a knowledge-based theory of the firm and further research and advancements in this field have been claimed recently by Nonaka and colleagues themselves (Nonaka & Von Krogh, 2009; Nonaka, Von Krogh & Voelpel, 2006). The qualitative methodology is bibliographic and comprises – among others - the methods of citation analysis and content analysis. A resulting selection of 135 papers, 4 dissertations/theses and 4 books constituted the research’s final database. Data analysis consisted of three flows of activities: data reduction, data displays (in the forms of both conceptual and mind maps) and conclusion drawing/verification. The results point out to the identification of four major groups of enabling conditions – social/behavioral, cognitive/epistemic, informational and business/managerial - which can be singly or freely combined into different knowledge processes – creation, sharing/transfer and use – occurring in different levels of interactions – individual, group, organizational and inter-organizational. Based on these results, a decision cube is proposed in the form of a framework for designing enabling contexts in knowledge organizations. These findings can be insightful for managers interested in creating and/or developing effective ba or enabling contexts to foster knowledge creation and innovation in their organizations, as they can utilize these frameworks to analyze, discuss, apply, manage and commit to specific combinations of enabling conditions based on their awareness of knowledge processes and levels of interaction. The conclusions suggest that the concept of ba and its underlying concepts are indeed sine qua non conditions for organizational knowledge creation and innovation processes, though ba is still both theoretically and empirically under-explored. Concerning the management of enabling contexts in knowledge organizations, the study revealed that the main arising challenges rely on the implementation and development of the issues comprised on the four groups of enabling conditions identified, most especially social/behavioral – norms and values that guide social contextual interactions, thus providing a fertile ground for knowledge creation and innovation - and business/managerial – concerning organizational culture and structure, change management, leadership and the development of new HRM systems for connecting knowledge assets and performance, thus achieving the necessary speed to be agile, flexible and innovative in the 21st century’s knowledge society. A research agenda for ba is suggested in the fields of open innovation, social networks – such as wikis, blogs, social tagging, among others - and epistemic communities.
Introduction

Knowledge creation is a fragile organizational process, particularly towards the nature of knowledge itself: fluid, dynamic, intangible, tacit and explicit, embodied in individual and groups, socially constructed, and constrained by individual and organizational barriers (von Krogh et al. 1997, 2000). In this paper, knowledge is approached through a constructionist perspective, as human cognition is not an act of representation and not just a machine for information processing and logical reasoning. In the constructionist perspective, cognition is an act of construction and creation (Maturana and Varela, 1987), as well as knowledge is tacit, explicit and cultural (Choo, 1998). Knowledge resides in one’s cognition as well as in between creative heads with synergetic purposes (Alvarenga Neto 2007, 2008, 2009).

Organizational knowledge creation is generally associated with “knowledge-based views and theories of the Firm” (Grant, 1996; Nonaka & Von Krogh, 2009) and “knowledge management” (KM), being the latter a controversial, complex and multifaceted subject. In spite of the fact that the term (KM) is not yet stable, there’s been a growing interest worldwide within the past two decades - from academics to practitioners - in the management of organizational knowledge and its related topics, such as “organizational epistemology” (Tsoukas, 2005), “knowledge creation processes” (Choo, 1998), “knowledge-based theory of the firm” (Nonaka et al., 2006), “enabling context and conditions” (von Krogh et al., 2000), “knowledge types” (Blackler, 1995), “knowledge assets” (Boisot, 1998) and “knowledge taxonomies” (Alavi and Leidner, 2001), among others.

In Alvarenga Neto’s (2007, 2008, 2009) studies within the last ten years, concerning the management of knowledge in world-class organizations, similar topics and approaches have been discussed, but above all, this author has stressed out three main concerns, based on his studies of KM initiatives in the Brazilian organizational context, where ba turned out to be one of his main findings: (i) a long standing misinterpretation that considers knowledge management and information management (IM) as synonyms. This shall be called “information reductionism”, as the “map is not the territory” (Tsoukas, 2005). IM is just one of the components of KM, as KM also incorporates concerns as to the creation, sharing and enabling context/conditions for organizational knowledge creation; (ii) a long overlooked topic in the KM literature: KM implementation processes (Alvarenga Neto et al., 2009); and finally (iii) an empirically under-explored concept: “the concept of ba” or “enabling context”, the ontological platform for knowledge creation:

“[…] Knowledge originates in ba, and therefore the concept of ba assumes a particular importance in organizational knowledge creation theory. While ba is theoretically relevant, it is also empirically under-explored.” (Nonaka et al., 2006)

As different authors have explored the two first concerns stated above, it seems reasonable to focus on the third main concern and proceed for further exploration and exploitation of ba. Therefore, this paper’s main objectives are to investigate and analyze the concept of ba – or enabling context - in the fields of management/business, information science and information systems literature in order to understand its conceptual evolution (if any), discussions, applications and expansion since its introduction in 1998 by Nonaka et al. (Nonaka and Konno, 1998; Nonaka et al., 2000; Nonaka and Toyama, 2002; Nonaka et al., 2006). This paper is structured in five major parts: (i) this introduction, (ii) the methodology (iii) the literature review, (iv) data analysis and (v) conclusions. The study and its results shall be presented in the lines below.
Methodology

The qualitative methodology is bibliographic in nature, comprising – among others – bibliometric methods of citation analysis and content analysis. To begin with, tools such as “citation report” and “cited reference search”, among others, available at the “ISI Web of Knowledge” e-resource were used. Part of the research’s rationale involved searching the “Web of Knowledge” having “ba” or the “concept of ba” as descriptors combined along with its mainstream author in the business and management field, Ikujiro Nonaka.

The results demonstrate that with an H-Index of 4 (which means that four papers have been cited more than four times, excluding self-citations), four of Nonaka’s papers (with the search criteria adopted above) have been cited 592 times since 1998 in papers all over the world, with an average of 49.33 citations per year. Therefore, to begin with, the research’s database comprised a total of 598 papers, as we have also chose to include two of Nonaka’s papers about ba that were not contemplated by an H-index of 4, but, after all, regarded as relevant in order to analyze the evolution of the author’s ideas, concepts and applications through a chronological perspective. Hereafter, Nonaka’s original papers about ba will be referred to as “the first generation papers” and all of the other citing papers of Nonaka’s ba or enabling context concepts as “the second generation papers”. These 592 papers (H-Index 4) were grouped by the number of times these second generation papers were cited by others: more or less than 20 citations. The number 20 was intentionally chosen, as to have a minor group of second generation papers (32 papers) that were highly cited by others, and a major group of papers that haven’t had the same repercussion. This criterion was helpful in order to reinforce our initial presumption concerning the empirical under-exploration of ba. Consequently, we have decided to examine the citation report of Nonaka’s two papers not contemplated with an H-index of 4 and all of the papers that cited those two.

These “second generation papers” were examined by searching within each document for the descriptors mentioned above with the aid of “EndNoteWeb” and “EndNote” softwares, besides the search tools available in “Adobe Acrobat” and “Microsoft Office”. Duplicates were eliminated and a few papers were not available. At this point, it’s important to mention that even Shimizu’s(1995) paper - uncountably cited and regarded by the first generation papers as the cornerstone of the ba principle in Nonaka’s work (along with Nishida’s, 1990) - was not available, even in e-resources such as Factiva, Business Abstracts and Proquest, among others. An extra-search effort in different interconnected libraries and e-resources was also conducted showing no results. After this criterion - a data reduction process in data analysis - the number of second generation papers selected so far for manual analysis went from 593 to 50 papers, which added to the 4 “first generation papers” comprised a total of 54 papers to begin with.

After these first search criteria partial results, we decided to go beyond bibliometrics and expand our research database in order to look for more papers discussing the concept of ba and its underlying concepts. For this purpose, we also decided to include descriptors such as “enabling context”, “enabling conditions” and “enabling knowledge creation” to the existing descriptors (”ba”, “concept of ba” and “Nonaka”), as these descriptors were highly cited in the references of the “first generation papers”. Consequently, based on the same criteria described above, the search was expanded to the following (FIGURE 1): (i) e-resources; (ii) e-journals containing “Knowledge Management” in their titles - search criteria involved the use of descriptors’ search within title, abstract and keywords; (iii) “Google Scholar” (page rank/relevance - availability of paper online considered, elimination of duplicates) and “Google Book Search” (searching for material not previously published in the form of papers in journals) – extra search criteria using authors’ names from the “first
generation papers” or authors cited by the “first generation papers”; (iv) papers cited in the references of the “first generation papers”, papers sent to us by peers or simply “serendipity”.

A resulting selection of 135 papers, 4 dissertations/theses and 4 books constituted the research’s database, which were all selected for manual analysis. It’s important to heed attention to the fact that the bibliographic research proposed here intends to be comprehensive, but never exhaustive. The time-span comprehends papers published from 1991 to 2009 and the authors were academics and practitioners from many different countries such as Japan, Finland, Portugal, Brazil, Canada, the Netherlands, Spain, France, Greece, Great Britain, South Korea, USA, Australia, China, Italy, Israel, Germany and South Africa among others.

![Figure 1: Research’s database assemblage. Source: developed by the authors.](image)

As for data analysis of the research’s database, it consisted of three flows of activities: data reduction, data displays and conclusion drawing/verification (Miles and Huberman, 1984). Displays in the form of conceptual and mind maps were built and proved useful for all of the three flows of activities, constituting analytical categories. Seven data reduction cycles were necessary in order to make the research data feasible to incorporation in this paper. In the following section, the literature review will be presented, followed by a discussion of data analysis.

**Literature Review**

Following the methodological choices stated above, the literature review presented hereafter is based on the “first generation papers” written by Nonaka and colleagues (Nonaka and Konno, 1998; Nonaka et al., 2000; Nonaka and Toyama, 2002; Nonaka et al., 2006) about the concept of ba. Before proceeding to the exploration of the concept of ba, it’s imperative to bear in mind that ba was firstly introduced by Nonaka and Konno (1998) and since then it has been used as one of the components of Nonaka’s et al. (2000, 2002, 2006) propositions in their pursuit towards a knowledge-based theory of the firm:
Organizational Knowledge Creation is defined as the process of making available and amplifying knowledge created by individuals as well as crystallizing and connecting it to an organization’s knowledge system. [...] Organizational Knowledge Creation Theory proposes concepts and relationships regarding organizational enabling conditions and ba, organizational forms, as well as leadership that explain the conundrum of firm differences, and hence provide the building blocks of a knowledge-based theory of the firm. Due to the inter-subjective nature of knowledge, firms differ because organizational knowledge creation gives rise to unique organizational knowledge systems.” (Nonaka et al. 2006)

Nonaka’s et al. (2000, 2002, 2006) propositions for a dynamic organizational knowledge creation theory are synthesized in FIGURE 2, where ba is one of the components of each:

Figure 2: Synthesis of Nonaka’s et al. (2000, 2002, 2006) propositions towards a knowledge-based theory of the firm. Source: adapted by the authors.

According to Nonaka et al. (2006), the context for knowledge creation is ba and a central purpose of organizational knowledge creating theory is to identify conditions enabling knowledge creation in order to improve innovation and learning. As stated earlier, Nonaka et al. (2006) attest the uppermost relevance of ba and the fact that it is empirically under-explored. This not only quite justify our efforts in this research, but also opens up for the exploration of further contributions about ba, enabling context and enabling conditions as well as the exploration of ba outwards the SECI (socialization-externalization-combination-internalization) process.

Nonaka and Konno (1998) started the discussion about the concept of ba by presenting a seminal question: “Is it possible to actually manage knowledge like other resources?” In order to address this question, they introduced the concept of “ba”, roughly translated into the English word “space”. They state that the concept of “ba” was proposed by Japanese philosopher Kitaro Nishida (1990) and further developed by Shimizu (1995). This “space for
emerging relationships” can be physical (e.g., office, dispersed business space), virtual (e.g., e-mail, teleconference), mental (e.g., shared experience, ideas, ideals), or any combination of them. It is stressed that the difference between “ba” and ordinary human interaction is the concept of knowledge creation: “we consider ‘ba’ to be a shared space that serves as a foundation for knowledge creation” (Nonaka & Konno, 1998).

From such perspective, knowledge exists and resides in “ba”, or, put in the authors’ words, “knowledge is embedded in “ba” or the shared spaces”. From their epistemological perspective, Nonaka and Konno (1998) outline the fact that knowledge cannot be separated from “ba”, or otherwise it will become information. Information resides in media and it’s tangible and, in its turn, knowledge resides in “ba” and it is intangible. Therefore, “ba” exists at many levels and these levels may connect to form a “greater ba”, known as “basho”. They also suggest that the use of knowledge requires the concentration of knowledge assets at a certain time and space and they name this concept as “organic concentration”.

In Nonaka & Konno’s (1998) view, “ba” offers an integrating conceptual metaphor for Nonaka’s (1991) SECI model of dynamic knowledge conversions and it is discussed from this perspective - that organizational knowledge creation is a dynamic and continuous interaction between tacit and explicit knowledge. Four types of “ba” correspond to the four stages of the SECI Model (FIGURE 3) and each “ba” supports a particular conversion process, therefore speeding up the process of knowledge creation:

![Figure 3 – The four characteristics of ba. Source: Nonaka and Konno, 1998.](image)

Nonaka et al.(2000) enhanced the idea of ba proposed by Nonaka & Konno (1998) in order to understand the dynamic process in which an organization creates, maintains and exploits knowledge. For this, they proposed a model of knowledge creation (FIGURE 2) where ba is one of the components. This model consists of three elements (i) the SECI Process, (ii) ‘ba’- the shared context in motion for knowledge creation and (iii) knowledge assets. Appending to Nonaka and Konno (1998), they assert that knowledge needs a context to be created, since “there’s no creation without place”: 

“[…] in knowledge creation, generation and regeneration of ba is the key, as ba provides the energy, quality and place to perform the individual conversions and to move along the knowledge spiral. […] knowledge is created through the interactions amongst individuals or between individuals and their environments. […] ba is the context shared by those who participate in ba. […] ba is the place where information is interpreted to become knowledge.” (Nonaka et al., 2000)

To certain extent, Nonaka et al. (2000) shed more light on the concept of ba by suggesting that the four types of ba are defined by two dimensions of interactions: (i) the type of interaction (individually or collective) and (ii) the media used in such interactions, whether face-to-face contact or virtual media such as books and e-mails. Two other important
distinctions were also established concerning the concept of ba: (i) the concept of ba and the concept of “modular organizations” are not synonyms and (ii) there are differences between the concept of communities of practice (living places where members learn new knowledge that is embedded in the community) and ba (a living place where knowledge is created). Nonaka and Toyama (2002) summarize Nonaka and colleagues’ previous discussion about ba with a few minor add-ons:

“[…]{knowledge does not just exist in one’s cognition, rather, it’s created in situated action. Ba offers a context and is defined as a shared context in motion, in which knowledge is shared, created and utilized, ba is a place where information is given meaning through interpretation to become knowledge, and new knowledge is created out of existing knowledge through the change of the meanings and contexts. […] Ba is an existential place where participants share their contexts and create new meanings through interactions. Ba is a way of organizing that is based on the meaning it creates, rather than a form of organizations such as a bureaucracy or network. […]ba involves various contradictions.” (Nonaka and Toyama, 2002)

Nonaka and Toyama’s (2002) goal is again the proposition of a dynamic theory of the firm (or a knowledge-based view of the firm) where ba is quintessential (FIGURE 2). They argue that a firm can create new knowledge and capability that go beyond the balancing point in the existing frontier with its synthesizing capability, which is embedded in its knowledge vision, its ba, its creative routines, its incentive systems and its distributed leadership. Finally, Nonaka et al. (2006) discuss ba and enabling conditions such as care, trust, courage, teams atmosphere and information technology, among others, as well as other issues such as the concepts of “knowledge vision”, “knowledge activist” and the “hypertext organization”.

At this point of our literature review, it is already possible to establish links between an eastern/Japanese concept of ba and its similar western approach - mainly represented in the works of Von Krogh (1998) and Von Krogh et al. (1997, 2000) - involving concepts and ideas such as “enabling context”, “enabling conditions”, “knowledge activists” and “care in knowledge creation”. These discussions and the analysis of the “second generation papers” will be our goal in the next section, as we’ll try to understand the concept of ba’s discussion, development, applications and expansion since its introduction by Nonaka et al. (1995, 1998, 2000, 2002, 2006).

Data analysis

In this section, we’ll briefly analyse “the second generation papers” comprised in our research’s database. Through our data analysis processes, particularly in the phases of data reduction, five major categories emerged as ways of grouping our research findings, namely (FIGURE 4): (i) conceptual/theoretical, (ii) social/behavioural, (iii) cognitive/epistemic, (iv) informational and (iv) business/managerial. With the exception of the first major category (conceptual/theoretical), the remaining four - henceforth called “the four groups of enabling conditions” - were observed in different knowledge processes – creation, sharing/transfer, use – and in different levels of interaction – individual, group, organizational, inter-organizational (FIGURE 4). They were also not solely use in the context of the SECI process (e.g. Jyrama and Ayvari, 2006; Miles et al., 2000), as advocated by Nonaka and colleagues (1998, 2000, 2002, 2006). This might be seen as an evolution in terms of application of ba.
Concerning the first major category – conceptual/theoretical, our analysis demonstrates that the concept of ba is still theoretically underexplored, although its discussion has somehow been expanded to different contexts or as a component of other theoretical propositions. The concept of ba was used for – or as a basis of part of - new conceptual or theoretical propositions/discussions; or papers where further theoretical and empirical support was proposed to the concept of ba by Nonaka and colleagues (FIGURE 5).

At this point of our analysis, it’s important to bear in mind that different groups of enabling conditions support different ba in different ways, as well as the fact that ba and enabling context are used as synonyms. As mentioned above, the four remaining major
categories constitute four different groups of enabling conditions. These groups of enabling conditions can be used singly or in any combination with the purpose of creating or enhancing an organization’s enabling context or ba.

The first group of enabling conditions is social/behavioral and involves norms and values that guide relationships and interactions in order to create a fertile ground for knowledge creation, sharing and use, as well as for facilitating innovative thinking. Our main findings suggest that the following issues should be taken into account, as they give rise to particular behaviors that should be communicated to and pursued by personnel and managers, as well as serve as guidelines for HRM assessments, such as hiring, training, utilizing, maintaining and compensating:

- care, mutual trust, lenience in judgment, active empathy, courage and access to help (Inkpen, 1996; von Krogh, 1998; Burton, 2002; Lee and Choi, 2003; von Krogh et al., 2008);
- tolerance to “honest” mistakes and mutual respect (Alvarenga Neto, 2008);
- actively encouragement of participation, nurture of innovating language while avoiding hypercorrection (von Krogh et al., 2000);
- accessibility of individuals and attentive inquiry (Nonaka and Nishiguch, 2001);
- interaction and open dialogue (Gold et al., 2001; Sabherwal and Becerra-Fernandes, 2003),
- collaboration (Lee and Choi, 2003);
- autonomy of freedom (Ford and Angermeir, 2005);
- contextual social interactions and evolving relationships (Peltokorpi et al., 2007).

Here are a few excerpts that support our findings:

“[…]However, in our search for enabling conditions, we have found values guiding relationships in organizations to be of particular importance, and the value of care in organizations relationships is one key enabling condition. […]Bear in mind that what will make or break the transformation into a ‘knowledge-creating company’ will not be the overall structural approaches of “managing knowledge”, but your sensitivity to the way people relate” (von Krogh, 1998)

“[…]to accomplish this it’s necessary to stress the importance of employee interaction for building relationships and contacts that enable the share of different perspectives.” (Gold et al., 2001)

Our second group of enabling conditions – cognitive/epistemic, is related to common knowledge or shared epistemic values and commitments. It’s a sine qua non condition the existence of shared beliefs and ideas, as well as people with different backgrounds and mental models, enabling a context where contradictions and diverging ideas are seen as positive issues, not as obstacles for knowledge creation and innovation. Our findings are structured around the following issues that might constitute guidelines, especially into addressing complex problems and the need for developing an organization’s accelerated solutions environment:

- exposure to a great variety of data, insights, questions, ideas and problems (von Krogh et al., 1997);
- application of creative techniques for metaphors, analogies and insights (von Krogh et al., 1997; Burton, 2002);
- existence of a sound mix of people from various cultural backgrounds and functional areas (von Krogh et al., 1997), existence of diverse perspectives and backgrounds (Gold, et al.,
2001; Peltokorpi et al., 2007) and existence of inter-organizational communities formed by people with different mind-sets and mental models (von Krogh et al., 2008);

- existence of formal and informal groups or communities (e.g., microcommunities of knowledge) with their own rituals, languages, norms and values (von Krogh et al., 1997);
- creation of shared spaces and shared goals (Lechner and Dowling, 2003; von Krogh et al., 2008; Balestrin et al., 2008; Brannback et al., 2008), and the sharing of mental models (Burton, 2002);
- development of dialectical thinking (Nonaka and Toyama, 2002) and a legitimate language (von Krogh et al., 2000), as well of awareness of a company paradigms, in terms of values, strategic intention and mission (von Krogh et al., 2000);
- provision of enabling conditions such as creative chaos (Inkpen, 1996), intention and requisite variety (Johnson, 2000);
- production and sharing of practical knowledge, meeting in different constellations and creation of common knowledge (Alavi and Leidner, 2001; Roth, 2003).

The following excerpts are supportive of our findings:

“[…] The existence of formal and informal situations so that the businessmen can share abilities, experiences, emotions and know-how, by means of face-to-face communication, promoted an environment of intense sharing of tacit knowledge.” (Balestrin et al., 2008)

“[…] being exposed to a great variety of data, insights, opportunities, questions, ideas, issues and problems; picking on those signals and formulating “process triggers” in the form of questions ‘why, how, what, where, when and who’; being aware that the space or a context for knowledge creation requires an innovative blending of architectural innovations, intervention and moderation techniques (encouragement, setting of the rules, applying of creative techniques for metaphors, analogies and insights); and a sound mix of people from various cultural backgrounds and functional areas. […] these communities are characterized by its own rituals, languages, norms and values […] in the minds of each lives the image of their communion.” (von Krogh et al., 1997)

“[…] recognition of new businesses opportunities might require an innovative vocabulary that includes words like neutraceuticals, infotainment, edutainment, or cybershopping. […] the articulation of new knowledge requires a process in which people move from broad distinctions to increasingly fine ones. […] a company’s strategic intent, vision or mission statements, and core values constitute its paradigm or worldview. Paradigms influence an organization’s daily life: defining the themes discussed in management meetings, the language used, the routines followed and even data and information employees are likely to search for as well as how the data should be interpreted.” (von Krogh et al., 2000)

The third group of enabling conditions is informational, regarding IT (information technology), IS (information systems) and IM (information management), as well as information/communication processes. Our findings are suggestive that a combination of multiple IT/IS tools, systems and applications - guided by IM processes design based on a company’s strategic issues, knowledge vision and communication strategy - are powerful enabling conditions, especially in the knowledge processes of sharing/transferring and use, within the interactional levels of groups and organizations. It’s important to bear in mind that IT is only an enabler and not an end in itself. Here’s a summary of tools, systems and
applications cited in our analysis along with a few suggestions on the way they can be effectively applied:

- internet, intranet, yellow pages, business information systems, groupware, databases, data warehousing, datamining, document repositories, software agents, repositories of information, best practices and lessons learned (von Krogh et al., 1997, 2000; Nonaka et al., 1998; Alavi and Leidner, 2001; Sabherwal and Becerra-Fernandez, 2003; Chou and Wang, 2003; Lee and Choi, 2003);
- information systems designed to support collaboration, coordination and communication processes as a mean to facilitate teamwork and increase an individual’s contacts with other individuals (Alavi and Leidner, 2001);
- e-mails and group support system in order to increase the number of weak ties in organizations (Alavi and Leidner, 2001; Chou and Wang, 2003);
- computer simulation and smart software tutors to support individual learning in intranet environments (Alavi and Leidner, 2001; Tee, 2005);
- computer-mediated communication as a way to increase the quality of knowledge creation by enabling a forum for constructing and sharing beliefs, for confirming consensual information and for allowing expressing of new ideas (Alavi and Leidner, 2001);
- problem-solving systems based on a technology like case-based reasoning (Sabherwal and Becerra-Fernandez, 2003);

The following excerpts are supportive to our findings:

“[…] Data warehousing and data mining, documents repositories, and software agents, for example, may be of great value in cyber ba. We further suggest that considering the flexibility of modern IT, other forms of organizational ba and the corresponding modes of knowledge creation can be enhanced through the use of various forms of information systems.” (Alavi and Leidner, 2001)

“[…] This study suggests that organizational ba and information distribution can be facilitated by the use of various capabilities of modern IT. For example, IS designed for supporting electronic repositories, collaboration, communication, e-mail, and simulation software, can facilitate teamwork, exchanging and organizing knowledge as well as individual learning.” (Chou and Wang, 2003)

At last, the fourth major group of enabling conditions is business/managerial and the issues considered are ways that managers can, in fact, directly construct, influence, interfere and manage an organization’s effective ba or enabling context by commitment and action. This group of enabling conditions also considers business processes where the concept of ba was actually applied in different researches. Here is a summary of our findings that can be useful guidelines for the management of enabling contexts in knowledge organizations:

- organizational culture: a critical issue to facilitate knowledge creation, a central issue to be shaped in a firm’s ability to manage its knowledge more effectively and the most prominent enabler (Inkpen, 1996; Perez Bustamante, 1999; Gold et al., 2001; Lee and Choi, 2002; Roth, 2003; Alvarenga Neto, 2007, 2008; Adenfelt and Lagerstrom, 2006 von Krogh et al., 2008);
- organizational structure: involves organizational structure that foster solid relationships and effective collaboration, such as project teams, cross-divisional units and empowered divisions, among others (von Krogh et al., 2000; Lee and Choi, 2003); systems-based
approach, hypertext organization (Gold et al., 2001, Nonaka et al., 2006); autonomous and self-organizing teams (Peltokorpi et al., 2007);

- **organizational and inter-organizational processes**: involves the application or studies/research of the concept of ba into business processes such as the management of salesforces (Bennet, 2001), ex ante project risk (Cuellar and Gallivan, 2005), supply-chain (Wu, 2008), inter-organizational healthcare communities (von Krogh et al., 2008), firms in networks (Lechner and Dowling, 2003), transnational projects (Adenfelt and Lagerstrom, 2006), family business context (Brannback et al., 2008), industrial districts (Corno et al., 1999) and collaborative inter-organizational R&D projects (Johnson, 2000);

- **human resources management and organizational learning initiatives/projects**: regards reward systems linked to knowledge-sharing (von Krogh et al., 2008) and the existence of flexible learning objectives (Inkpen, 1996); the cultivation of care through incentive systems, mentoring and training programs in care based behavior, project debriefing and other forms of learning-oriented conversations (von Krogh, 1998); use of apprentice and mentors to transfer knowledge, brainstorming retreats or camps, employee rotation areas, OJT, learning-by-doing and learning by observation (Sabherwal and Becerra-Fernandez, 2003); development of adequate team-atmosphere (Zárraga and Bonache, 2005);

- **architectural innovations**: creation of meeting and sharing organizational spaces/points (Balestrin et al., 2003; Lechner and Dowling, 2003; Alvarenga Neto, 2008); design of virtual and physical layouts and workplace environments (von Krogh et al., 1997; Alvarenga Neto, 2007,2008); promotion of regular knowledge conferences and supporting of microcommunities of knowledge (von Krogh et al., 2000); stimulus to social and informal gatherings (Bennet, 2001);

- **emergence of “knowledge facilitators” and “knowledge activists”**: such as epistemologists, care specialists, knowledge managers, information analysts, CEO, CKO, project managers and middle managers, among others (von Krogh et al., 1997, 2000; Roth, 2003; Alvarenga Neto, 2007, 2008; Nonaka et al., 2006); a company as a knowledge activist (von Krogh et al., 2008); role of mediators as enablers in knowledge creation (Jyrma and Ayvaari, 2007);

- **leadership**: concerns leadership styles and roles of leadership (von Krogh et al., 2008; Ford and Angermeier, 2004); leadership commitment (Inkpen, 1996); “selling of foresight” by providing overall direction and the knowledge vision of a firm (von Krogh et al., 1997, 2000); leadership’s tasks in constructing ba, creating enabling conditions and setting the pace for knowledge dynamism (Nonaka et al., 1998); phronesis (intellectual virtue) and flexible and distributed leadership (Nonaka and Toyama, 2007); role of top-management directing the knowledge-creation processes by creating visions and the role of middle-managers bridging top-management visions with the chaotic reality at front line, also managing and interlinking ba (Peltokorpi, et al., 2007);

- **strategy and knowledge vision**: communication of the company’s strategy and knowledge visions (Alvarenga Neto, 2007, 2008); instill a knowledge vision (von Krogh et al., 2000; Peltokorpi et al., 2007).

The following excerpts confirm our findings:

"[…] Ba is not a concept associated with any particular size of business or organizational structure; rather, it appears that the extent of ba within an enterprise depends on managerial attitudes, traits and dispositions." (Bennet, 2001)

"[…]analyze how organizational conditions, technology adoption, supplier relationship management and customer relationship management affect knowledge
Conclusions

This paper’s main goal was to investigate and analyze the concept of ba – or enabling context - in the fields of information science, management/business and information systems literature in order to understand its conceptual evolution, discussions, applications and expansion since its introduction in 1998 by Nonaka et al. (Nonaka and Konno, 1998; Nonaka et al., 2000; Nonaka and Toyama, 2002; Nonaka et al., 2006). FIGURE 6 synthesizes the overall study and the expansion of the concept of ba, bringing light to its unique features such as concepts, forms, emergence, types, case studies, multiple discussions and applications, as well as suggestions for future research:

Figure 6: Expanding the Concept of ba. Source: developed by the authors.
The results pointed out to the identification of four major groups of enabling conditions – social/behavioral, cognitive/epistemic, informational and business/managerial - which can be singly or freely combined into different knowledge processes – creation, sharing/transfer, use – that occur in different levels of interactions – individual, group, organizational, inter-organizational. For this reason, a decision cube is proposed in the form of a framework for designing enabling context in knowledge organizations (FIGURE 7). These findings can be insightful for managers interested in creating and/or developing effective ba or enabling contexts to foster knowledge creation and innovation in their organizations, as they can utilize these frameworks to analyze, discuss, apply, manage and commit to specific combinations of enabling conditions based on their awareness of knowledge processes and levels of interaction.

The conclusions suggest that the concept of ba and its underlying concepts are indeed *sine qua non* conditions for organizational knowledge creation and innovation processes, though ba is still both theoretically and empirically under-explored. Nevertheless, we have found that the concept has somehow been expanded as part of other theoretical discussions and/or in different contexts, but still demands further exploration, exploitation and development. Concerning the management of enabling contexts in knowledge organizations, the study revealed that the main arising challenges rely on all of the issues comprised on the four groups of enabling conditions identified, most especially social/behavioral – norms and values that guide social contextual interactions, thus providing a fertile ground for knowledge creation and innovation - and business/managerial – concerning organizational culture and structure, change management, leadership and the development of new human resources management systems for connecting knowledge assets and performance, thus achieving the necessary speed to agile, flexible and innovative in the 21st century’s knowledge society. A research agenda for ba is suggested in the fields of open innovation, social networks – such as wikis, blogs, social tagging, among others - and epistemic communities.
